

Textbook

Reviews of 1st edition

“The material is well organized and concisely (but fully) presented, with many examples and exercises ... many students and instructors will welcome this book as an accessible introduction to these areas.”

Mathematical Reviews

“The book is a valuable tool for a consistent course for a master’s degree, being written in a very accurate style.”

BANACH-HILBERT SPACES, VECTOR MEASURES AND GROUP REPRESENTATIONS

by **Tsoy-Wo Ma** University of Western Australia

This book provides an elementary introduction to classical analysis on normed spaces, with special attention paid to fixed points, calculus, and ordinary differential equations. It contains a full treatment of vector measures on delta rings without assuming any scalar measure theory and hence should fit well into existing courses. The relation between group representations and almost periodic functions is presented. The mean values offer an infinite-dimensional analogue of measure theory on finite-dimensional Euclidean spaces. This book is ideal for beginners who want to get through the basic material as soon as possible and then do their own research immediately.

Contents: Metric Spaces; Complete, Compact and Connected Sets; Banach Spaces; Simplicial Complexes; Topological Fixed Points; Foundation of Functional Analysis; Natural Constructions; Complex Analysis; Differentiation in Banach

Spaces; Polynomials and Higher Derivatives; Ordinary Differential Equations; Compact Linear Operators; Operators on Hilbert Spaces; Spectral Properties of Hilbert Spaces; Tensor Products; Complex Vector Lattices; Vector Measures on Semirings; Extensions of Positive Measures; Measurable Objects; Integrals of Upper Functions; Vector Integrals; Finite Products of Measures; Measures on Finite Dimensional Spaces; Indefinite Integrals; Differentiation of Measures; Spectral Measures; Locally Compact Spaces; Almost Periodic Functions on Groups; Group Representations; Saturated Closed Invariant Ideals; Mean Spaces.

Readership: Upper level undergraduates, graduate students, academics and researchers in the field of analysis.

Why You Need This book?

Vector measures are developed without assuming the scalar theory as prerequisite. Most courses in abstract measure theory can be replaced with our new approach without increasing the length of the course and without additional demand on students. INSTRUCTORS do not have to learn new trick because we use only the well-known technique but in more efficient and clever way.

Positive measure theory on sigma-rings is an abstract generalization of Lebesgue measure. NOW vector measures on delta-rings are the counter parts of Stieltjes measures. Decent sets are abstract form of bounded Borel sets. Vector measures including signed measures need not be bounded. The curriculum of university courses will not be changed unless YOU join in. It is time for change. Write YOUR own BETTER textbook to popularize decent sets and the World Scientific will be happy to publish it for YOU.

Mean-values behave like translation invariant integrals but in infinite dimensional spaces. It is a land waiting for new empire builders.

The book is self-contained taking the beginners to the research level at fast pace in the area of linear and nonlinear functional analysis; and also harmonic analysis of groups which need not be locally compact.
